

**miFormz** – a generic forms tool for MapInfo Professional tables. Available in Lite and Professional (available first qtr 2009) versions the admin tool provides the ability to specify a form using Text Boxes, List and Multi-List Boxes, Drop Down Lists, Radio Buttons and Tick Boxes. The values for the list controls can be provided in delimited text or from table lookups from other MapInfo Professional tables. The results are validated where appropriate e.g. dates, integers and decimals.

The **Lite** version, available as Shareware, is downloadable from our website [www.viewshed.co.uk](http://www.viewshed.co.uk). The form functionality is provided by a .Net tool outside of MapInfo Professional and communication between the tools is managed through two external files. This has been done so that miFormz Lite can be run on MapInfo Professional and RunTime Manipulator licenses from 4.5 to the latest version. So dig out those old non-upgraded copies and re-vitalise those RunTime licenses to achieve greater cost benefit!

Choose table

Combo Box and Radio Group Buttons using Value Lists to provide the data

Combo Box using a lookup

Form as displayed when the user creates an object or clicks info on a relevant object

The **Professional** version, available in the first quarter of 2009, includes auto-number and calculated field functionality. It is integrated with MapInfo Professional, therefore does not use the external files which Lite makes use of, and can therefore only be run on MapInfo Pro 9.5+.
